VARUN NAIR

Aspiring DevOps / Platform Engineer / SRE | Cloud, Linux & Automation
Thane, Mumbai | coderv13@gmail.com | +91 93216 56622
GitHub | LinkedIn | HashNode Blog | Portfolio

Profile

MCA student with hands-on foundations in Linux system administration, containerization, and AWS cloud basics, seeking a DevOps / Platform Engineering / SRE internship with real production exposure. Comfortable scripting in Python, Go, and Bash; has built production-style automation hardened with encryption and automated testing, containerized services with Docker and CI/CD security scanning, and shipped a machine-learning system for network anomaly detection. Also builds LLM-powered tooling (RAG, LangGraph agents, MCP), applying it to infrastructure and incident-response workflows. Eager to join a lean engineering team to take ownership, work hands-on with production systems, and learn fast.

Technical Skills

Operating Systems & Networking: Linux/Unix administration & CLI, systemd, TCP/IP, DNS, HTTP/HTTPS, SSH, firewall basics

Scripting & Programming: Python, Go, Bash/Shell, SQL, HTML, CSS

AWS: EC2, S3, IAM (least-privilege), Lambda, EventBridge, DynamoDB, CloudWatch, Elastic Beanstalk, CloudFront, Amplify, Bedrock

Infrastructure & Containers: Terraform (IaC), Docker & Docker Compose, Kubernetes (fundamentals)

CI/CD & Security: GitHub Actions (lint, SAST, dependency & vulnerability scanning, SBOM, image signing)

AI / LLM Engineering: RAG, Vector Databases, LangChain, LangGraph, AI Agents, Model Context Protocol (MCP), Amazon Bedrock, scikit-learn

Version Control & Databases: Git, GitHub, PostgreSQL, SQL / relational database fundamentals

Frameworks: Django, Flask

Projects

AI Incident & Anomaly Command Center *Hackathon, Team Lead (AWS/Infra) | GitHub*
AWS Lambda, EventBridge, DynamoDB, CloudWatch, Elastic Beanstalk, CloudFront, Amplify, Terraform, Amazon Bedrock, GitHub Actions

- Led AWS infrastructure and DevOps for a 3-person team at a 3-day hackathon (First Commit, Bharat Builds Tour 2026); built an event-driven pipeline that detects CI/CD failures, generates an AI root-cause explanation with Amazon Bedrock, and shows it on a live dashboard.
- Defined the full backbone in Terraform (EventBridge → Lambda → CloudWatch logs → Bedrock → DynamoDB) with least-privilege IAM per service; deployed a Spring Boot backend on Elastic Beanstalk behind CloudFront (HTTPS) and a React dashboard on Amplify, live end to end.

Cipher-Watch *Ongoing | GitHub*
Bash, Docker, Docker Compose, GitHub Actions, ShellCheck, Hadolint, Syft, Cosign

- Built five production-style Bash tools (backup, monitor, dependency-check, user-management, log-rotation) with AES-256/PBKDF2 encryption, SHA-256 verification, automated restore testing, and statistical anomaly detection, run as a systemd service/timer.
- Packaged into two hardened non-root Docker images (multi-stage, ∼140–150 MB) with Compose and health checks; CI with ShellCheck/Hadolint linting, Bats tests, Syft SBOM generation, and Cosign image signing.

AI-Driven Network Traffic Anomaly Detection System *Ongoing, co-developed | GitHub*
Python, Flask, scikit-learn, Docker, Docker Compose, GitHub Actions, WebSockets

- Built a full-stack intrusion detection system: Random Forest on CIC-IDS-2017 classifying 14 attack types with over 99% test accuracy, plus a Flask-SocketIO dashboard with live traffic charts, a threat gauge, and a Wi-Fi traffic simulator.
- Containerized with Docker Compose; GitHub Actions CI/CD with linting, Bandit SAST, and dependency vulnerability scanning.

Certifications & Courses

- Machine Learning Foundations Training Badge – AWS Academy
- Cybersecurity of Networks: From Scratch to Advanced – Udemy

Education

Master of Computer Applications (MCA) 2025–2027
VESIT (Vivekanand Education Society's Institute of Technology), Mumbai Aggregate CGPA: 8.49 (2 Semesters)
